

Creating Hospitals without Walls: Addressing Health at the Level of Individuals, Communities and Globally

David Allison FAIA, FACHA

Clemson University

European Healthcare Design | London 2018

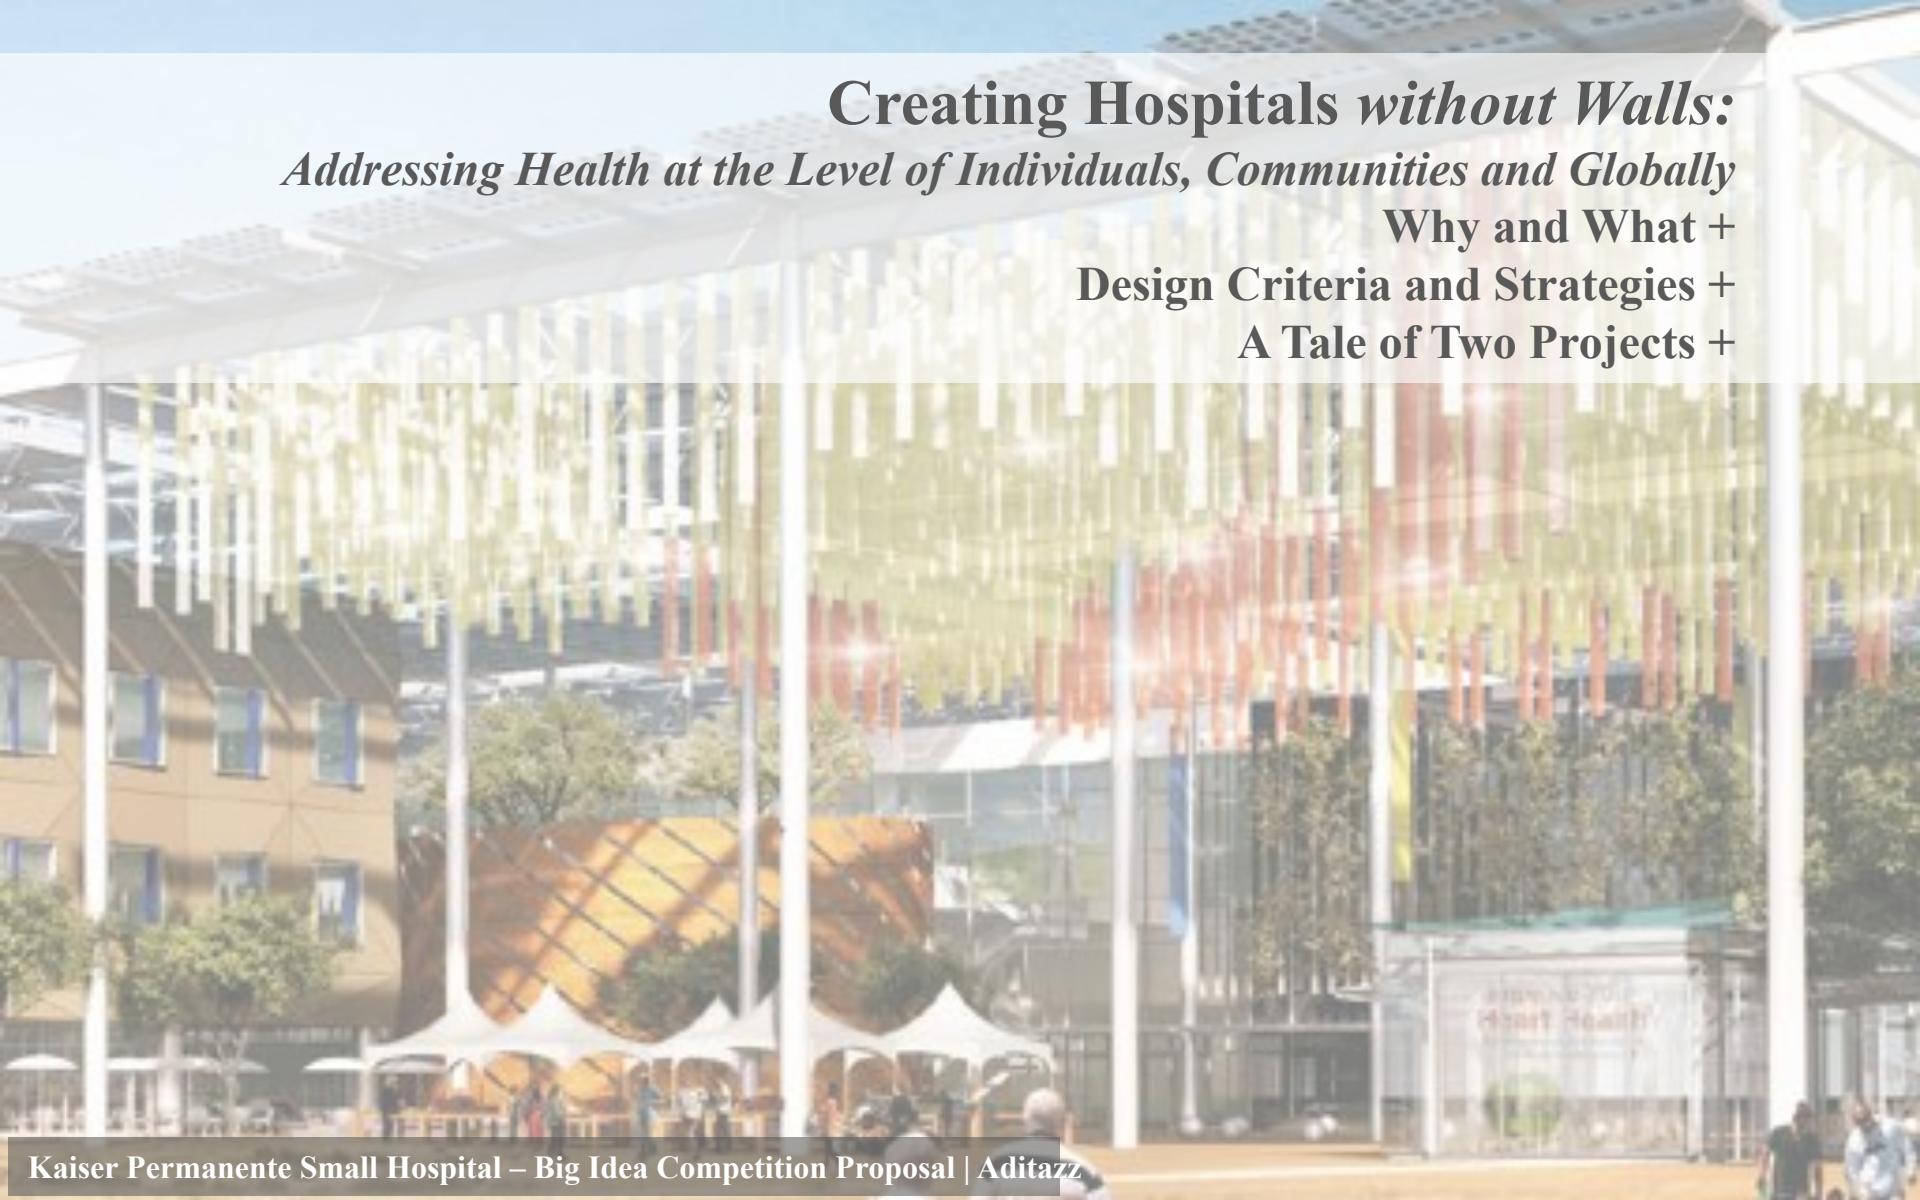

Creating Hospitals *without Walls*:

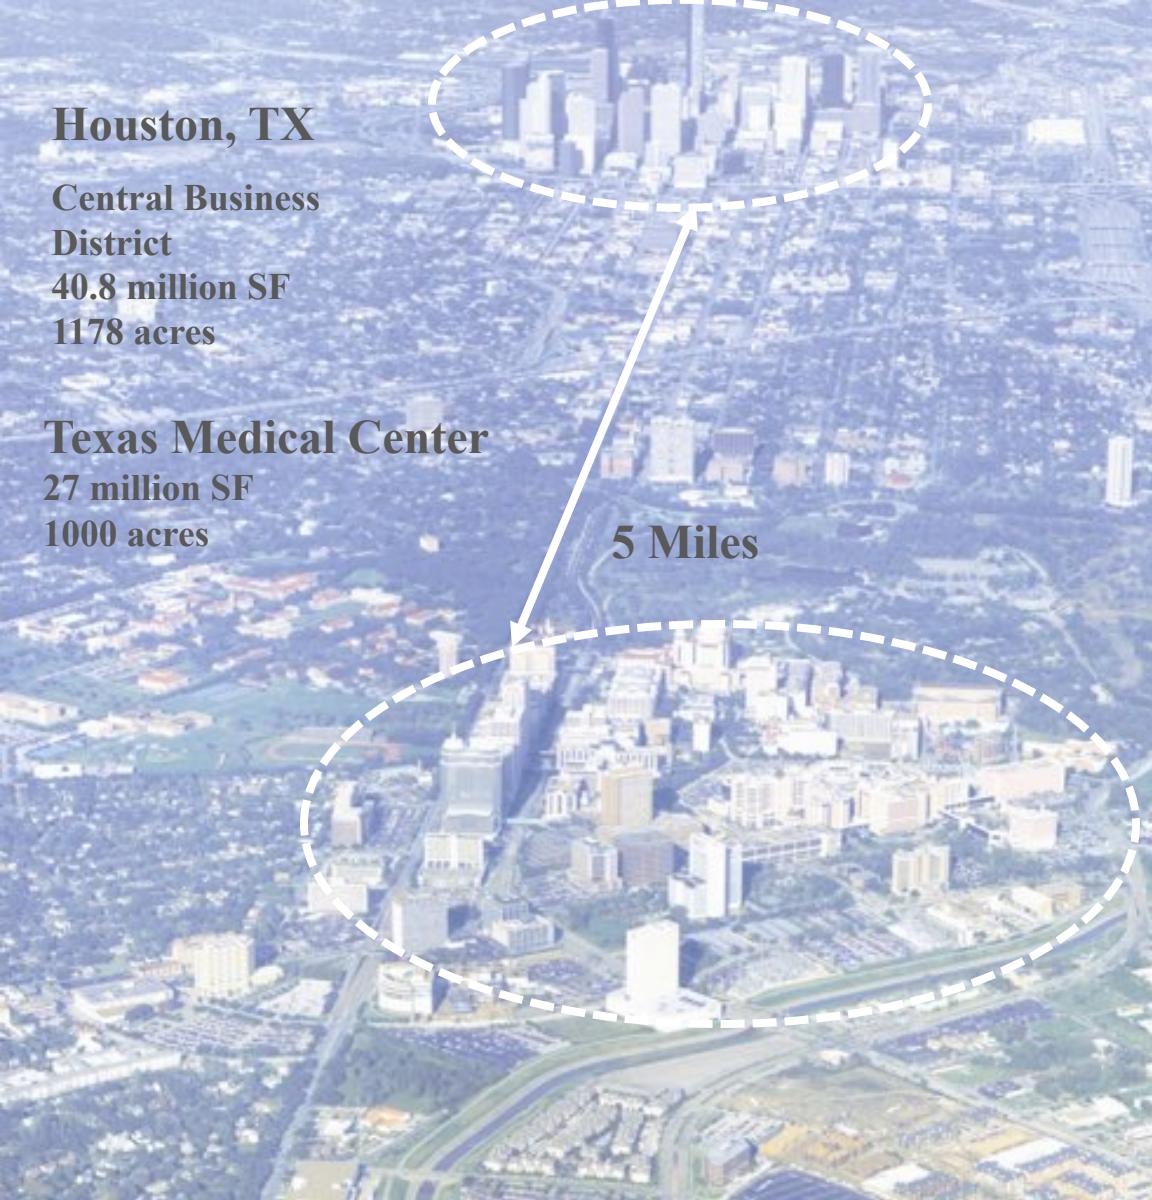

Addressing Health at the Level of Individuals, Communities and Globally

Why and What +

Design Criteria and Strategies +

A Tale of Two Projects +

Hospitals and large medical centers are inherently like towns and cities

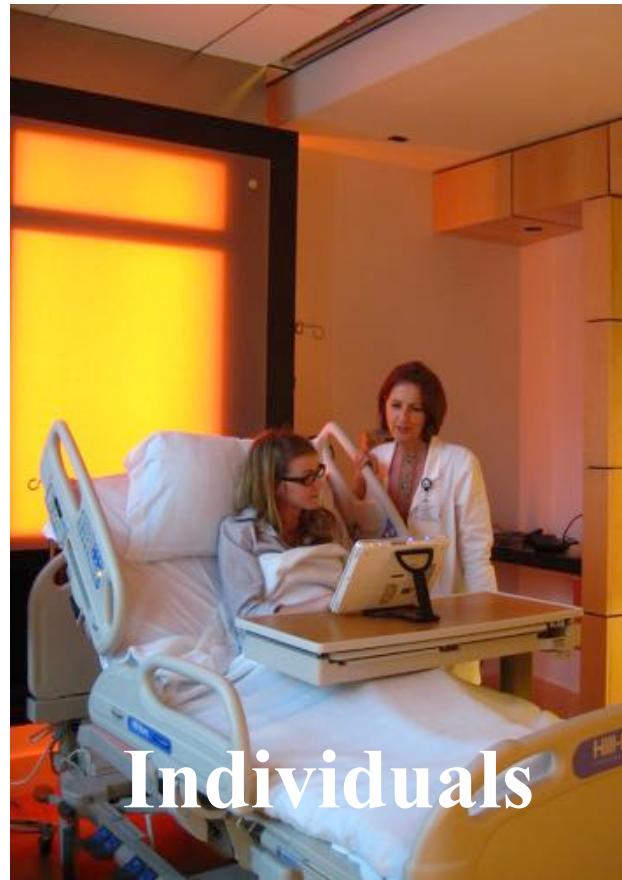

- 24/7/365
- All activities and events of life
- Constantly changing, evolving and growing
- Complex social, political, regulatory and economic forces
- Major employer and economic engines in their communities
- Significant impact on public infrastructure and the local environment

Given hospitals and medical centers have an implied if not explicit mission to protect and restore health [do no harm], they should represent best practices for creating healthy places

Proposed Focal Point Community Medical Center: Chicago | HDR

Healthcare organizations and environments should be designed to both promote and restore health at three scales:

Individuals

Communities

Globally

Health Campus Without Walls

How will the designer set the boundary between the campus and its surroundings?

When we talk about designing for the health of the campus and the surrounding community, we must keep in mind that there is more than one type of health.

We can think of health as falling into 5 major categories:

- 1. Mental
- 2. Social
- 3. Physical
- 4. Economic
- 5. Environmental

Only by creating designs that keep all of these in mind can we create a campus that is truly a healthy urban design.

BEYOND HEALING

How do we better integrate a medical campus with the public community?

Health Campus Without Walls

How will the design blur the boundary between the campus and its surroundings?

Walls can be created around our campuses in many ways. They do not need to be physical walls but rather are a result of how our campuses meet their urban context. When studying these transitions, we find that there are many different types of edges between spaces. These edges can manifest as hard edges that prevent movement through space, as soft edges that promote interaction between spaces or as something between the two.

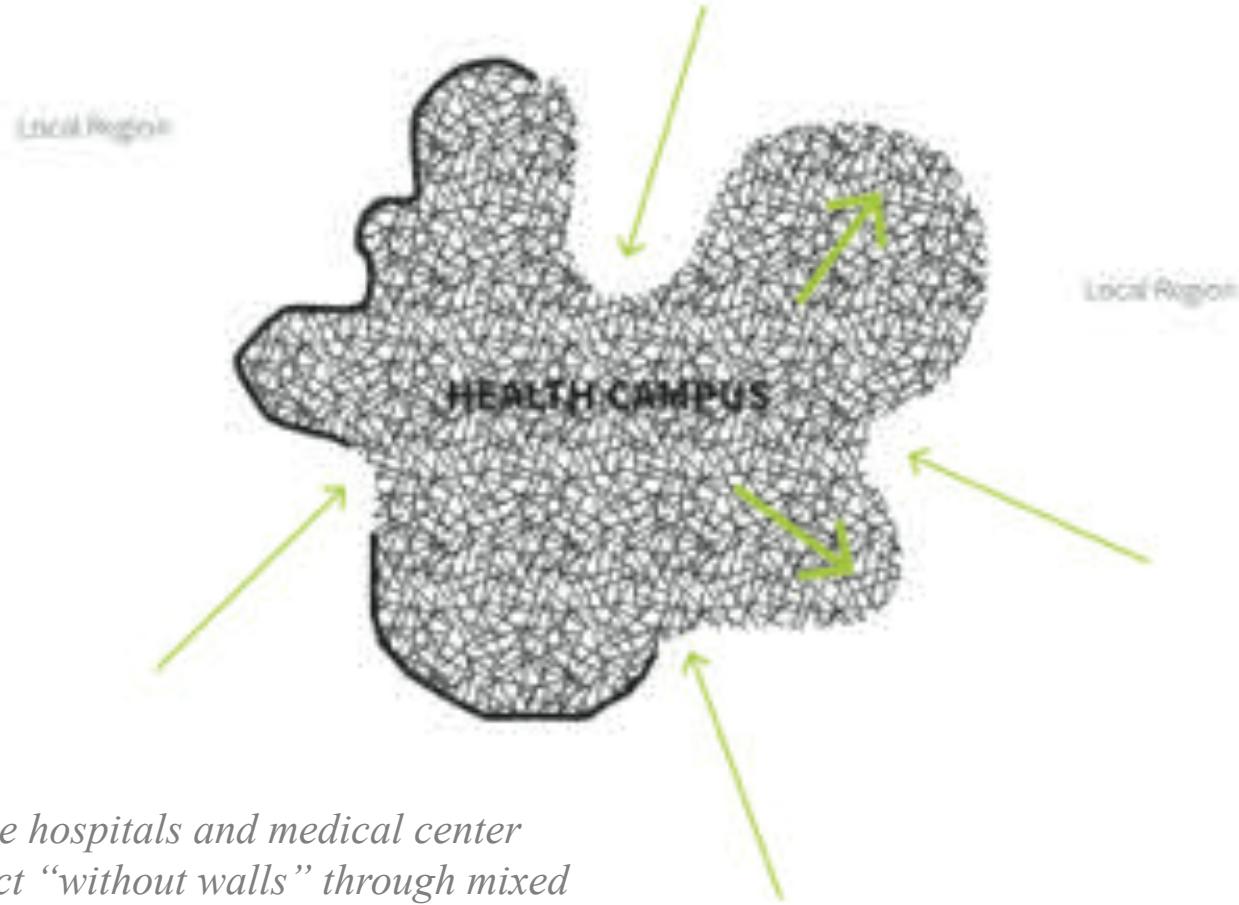

Health Campus Without Walls

How will the design blur the boundary between the campus and its surroundings?

In a well-defined urban campus, most of the boundaries between the campus and its context should be fluid, rather than ego "walls". We should seek to design spaces that can be subject to a push and pull between the region and the campus itself. This fluidity allows for a blurring of the boundaries between what is campus and what is city. This blurring ensures that both entities react and enrich each other rather than remaining walled-off neighbors.

- Intersperse clinical, research, academic, retail, residential and civic
- Blurred boundaries and transparent edges
- Indoor/outdoor public spaces
- Retail at street level
- Extension of the existing street grid and surrounding urban fabric

Create hospitals and medical center district “without walls” through mixed uses and blurred boundaries

DESIGN CRITERIA/ CONCEPT

ABILITY TO ACCOMMODATE GROWTH

DIVERSITY OF MIXED USES

PUBLIC SPACES & ACTIVITIES

SUSTAINABLE PARKING

WALKABILITY & ALTERNATIVE TRANSPORTATION

EASY ACCESS & LEGIBLE WAYFINDING

GREEN SPACES, ROOFS & WALLS

DAYLIGHT & CONNECTIONS TO NATURE

DESIGN STRATEGIES

Ability to Accommodate Growth and Change

The ability to accommodate growth and change includes four aspects: Adaptability, Convertibility, Transformability and Expendability.

Adaptability: the ability of the built environment to support a number of functions and physical reconfigurations without altering the architecture or structure of the facility.

Convertibility: the ability to accommodate varying functions through a certain amount of pre-determined conversion. This often requires construction duration and considering future renovations and expansions.

Transformability: the ability to alter the interior or exterior components of a space in response to specific committed or uncommitted need for new construction.

Expendability: the replication and/or expansion of existing facilities can be created at multiple locations and scales.

Why?

The future demands for healthcare facilities will be unpredictable and challenging. These facilities are pressed with meeting countless needs over the course of their lifetime and adapting to ever-changing modern technological advancements, social constructs, business practices, healthcare delivery methods, population growth and numerous other factors. Due to these foreseen and unforeseen factors, hospital facilities must be highly adaptable to maintain their relevance despite all ever-changing demands. Success on a long-term scale for these buildings is dependent upon dramatically reducing their life-cycle costs and maintaining a high-level of performance.

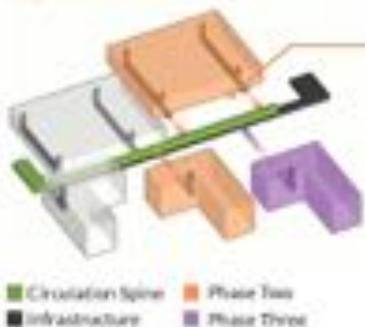

How to Implement

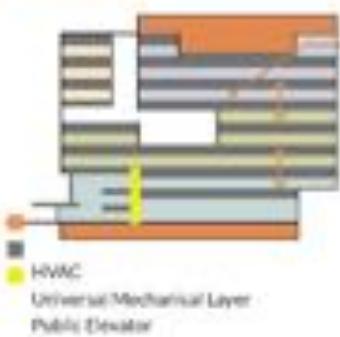

- **Site Placement:** By assuming a certain amount of obsolescence, demolition and new construction can be made less destructive to the site and existing facilities.
- **Infrastructure Standardization:** Structural uniformity allows for increased flexibility in later years. Common types of standardization include modularization and grid-based systems.
- **Plug and Play:** Creating permanent circulation paths and infrastructure with the ability to connect new modularized facilities into the main structure.
- **Determinative Zones:** Clearly defining different "hard" and "soft" zoning regions, allowing for expansion and demolition without disrupting critical connections.
- **Open-Ended Circulation:** Open-ended hallways which reach to building facades, enabling future connections with minimal disruption to established corridors.
- **Flexible Boundaries:** Creating clusters with similar functions and eliminating hard boundaries between them, allowing for integration and flexible use.
- **Shell Spaces:** Creating spaces that can support a diversity of functions while maintaining proximal relationships, until finer programmatic determinations are made.
- **Multi-Use Spaces:** Creating spaces that can be utilized for universal and other high-volatility functions.
- **Interstitial Floors:** Giving mechanical systems their own independent levels to enable ease of access and more easily facilitate reconfiguration, maintenance and replacement, with minimal disruption to daily activities.

Strategies

Plug and Play

Interstitial Floors

Case Studies

Banner Estrella Medical Center

Phoenix, AZ, USA
HKS/JL

Through the integration of temporary zones connected through a permanent circulation core, Banner Estrella Hospital, by HKS/JL, is designed to flexibly adapt to changes in business, the market, and technology. This revolutionary design was devised by planning backwards: first understanding where expansions would be placed and then constructing the current existing core and facilities. This approach ensures that there will be adequate room and support for expansion.

<http://www.hks.com/case-studies/banner-estrella-medical-center>
<http://www.hks.com/design-methodologies/expansion/>

Radike Health Gates Vascular Institute

Buffalo, NY, USA
Yardini Studio of CannonDesign

This facility supports maximum flexibility through its universal structural grid system and shell-like interior spaces, which can be easily retrofitted. Ceilings are kept at 10ft height and services such as stair and elevator cores are pushed to one side in order to allow for maximum flexibility within the floors. Along with horizontal flexibility, equipment and services are located in the "peripheries" and basement, to allow for maximum vertical flexibility.

<http://www.yardini.com/case-studies/radike-health-gates-vascular-institute>

Diversity of Mixed Uses

The prevailing conception of health is evolving from a pathogenic model focused on the treatment of illness, towards a salutogenic model focused on supporting health and wellness initiatives. This shift involves a wider programmatic diversity than what has historically been incorporated into healthcare settings. Through mixing commercial, residential, educational, and public activities within wider medical settings, we begin the necessary work of transforming hospitals from simply places for the sick, to centers for public and community life.

Why?

Healthcare architecture addresses the needs of the ill; we have thus developed a negative reputation as a place for the sick or dying. Though hospitals are frequently the busiest buildings in their respective neighborhoods and may be the most significant drivers of local public, professional, educational, and economic life, they rarely enjoy positive reputations. Nonetheless, they remain important civic institutions. We live born, die, and experience our most intimate times in them, give birth, and even ultimately we die in them. They are therefore worthy of reputations befitting their significance. By incorporating diverse functions into hospitals, we redefine our relationship to them.

As healthcare trends towards a population health model, healthcare design must engage with the community. To get people interested in health and wellness, healthcare facilities must become more intuitively integrated into community life. Rather than visiting hospitals alone during instances of illness, citizens must be motivated to revisit and participate in public health education and preventative care. The incorporation of mixed-use may be one significant way to accomplish this. By educating healthcare with other uses, including, but not limited to retail, restaurants, housing, etc., communities begin to intuitively engage in wellness initiatives.

Baton Rouge Health District
Perkins + Will

How to Implement

- Use the ground plane to engage pedestrians through storefront access
- Incorporate public spaces and gardens into the hospital grounds and landscaping
- Enable care partners to engage in public life while on the hospital campus through the use of restaurants and retail space
- Repurpose meeting spaces for after-hour public recreational use (e.g. an auditorium could be converted into a movie theater or public event space)
- Include libraries so patients, family members, and the community at large have a space where they can learn and engage with their health
- Provide spaces for out-of-school learning for inpatient children
- Add in-house childcare facilities for hospital workers
- Design spaces for informal gathering to foster relationships between patients and care givers (e.g. coffee shops or gardens)
- Provide temporary housing for patients and families who would otherwise have difficulty commuting
- Create areas where patients can interact with service animals as a means of alleviating stress
- Add gyms which offer memberships to the public and provide space for patient rehabilitation

Strategies

Strategic Community Planning and Zoning

batonrougehealthdistrict.com/zoning

Case Studies

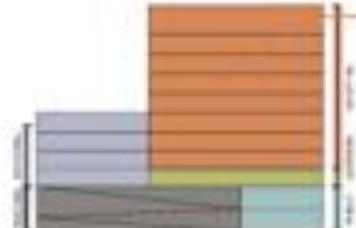

Baton Rouge Health District

Baton Rouge, Louisiana
Healthcare + WII

The Baton Rouge Health District focuses on the growth between two regional medical centers. The district supports population health to prepare for the future of healthcare. Street improvements will create healthy transportation opportunities for the community and better efficiency for emergency services. Mixed-use functions will improve the economy of the area ("eyes on the street" [Jane Jacobs]), and will allow the medical center to compete with others on the national stage. Wellness centers, farmers markets, and parks will all be featured in the district.

Pre-pandemic "Stacking"

nccdn.com/stacking

National Cancer Center

Rio de Janeiro, Brazil
Cannon Design

The hospital involves a partnership between private investors and the city government, which enabled its mixed use design. Included in the facility are shops, gardens, recreation spaces, an adult education center, public parking, and low-income housing. The public spaces and residential areas don't interfere with the medical spaces, but are woven in so they still interact.

Image source: nccdn.com/stacking; pre-pandemic policy national cancer center: J. C. Cannon and Associates; right facts sheet: nccdn.com/stacking

Active Public Corridor

How will the design activate the public space?

Importance:

Welcoming public space promotes **mental and physical health** among communities. The well-defined and accessible networks of public space create **social interaction** among local environment and communities.

Active Public Corridor

How will the design activate the public space?

Mixed-Use spaces

Mixed-use spaces engage community and hospital in various levels. Retail, restaurant, and arts not only have positive influence on patients, but also draw residents from neighborhood to this Active Public Corridor. The vibrant public spaces encourage communities to gather for public events, stimulate face to face interaction, and promote public health.

University Medical Center Groningen, Netherlands

BEYOND HEALING

How do we better integrate a medical campus with the public community?

How do we better integrate a medical campus with the public community?

MEET

Institute Landscape at UCLA

Public Spaces & Activities

"A public space is defined as one that provides access to all... It's a place where people can congregate and engage in multiple activities, a place of movement and flow, and a place of cultural enrichment... Favorite public spaces might be described as another intangible, however, loud, public or private, but in all cases they are memorable and enhance the human experience."

-John R. Pungello, FAIA, FACHA

Public space is more than just a front lobby & has the ability to shape the user experience and to influence the public health of the larger community. Public spaces and activities should provide access to all in order to engage the local community and create a gathering spot for social interaction & user connection. Public spaces that reflect the local culture and create a sense of identity for the surrounding community.

Why?

"Well-designed and maintained public space is critical to the health of any city. Such gathering spaces allow for socializing, civic participation, recreation, and a sense of belonging. Public space can also be used for daily events or seasonal annual fairs that bring together diverse populations of the city."

-UNESCO

Integrating public spaces and activities into the hospital campus supports the mission of healthcare systems to improve the health of the population. Public spaces and activities can also significantly impact the user experience. As healthcare becomes a consumer-based market, the patient experience will significantly impact hospital revenue stream. Hospitals should always strive to offer greater public spaces to create an inviting atmosphere that connects to the existing world and brings the community together for diverse & unique health experiences.

How to Implement

Programmatic Design Strategies:

- Program unique public services and activities into the hospital campus such as community gardens, teaching kitchens, and/or recreational facilities
- Create an interface between healthcare and community by providing public services on or near the ground level

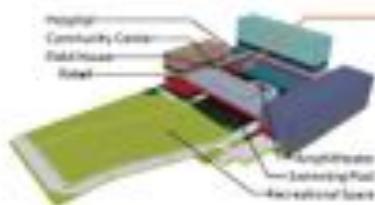

Spatial Design Strategies:

Healthcare public space can create a memorable and positive experience that helps the healing process. The unique functions of healthcare public spaces should be broken down into 4 typologies:

- **Collector Spaces** that are active and orienting, with high population densities levels.
Example: entrance lobby
- **Intrusive Spaces** that accommodate high volumes but are personal, quieter and calming spaces
Example: chapel
- **Purpose Spaces** that are dynamic and service-based for specific functions and varying volumes.
Example: dining hall
- **Mover Spaces** that feature constant movement and ebb-and-flow of user volumes.
Example: public concourse

Strategies

Programmatic Design

Case Studies

Focal Point Community Campus

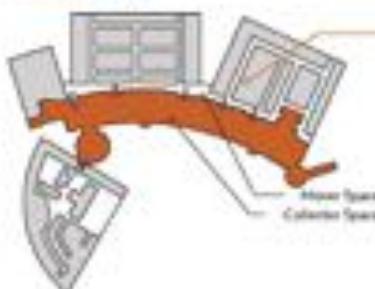

Chicago, Illinois
HOB

Located in one of the most vibrant yet blighted neighborhoods in Southwest Chicago, the Focal Point Community Campus envisions a public healthcare setting that embraces its local community. Fitness centers and community services run along the 2nd floor, while the ground floor is wrapped in glass and provides wellness gardens and recreation areas for public use.

Image source: http://www.hob.com/2010/01/focal-point-community-campus.html

Spatial Design

Cherokee Indian Hospital

Cherokee, North Carolina
Design Strategies

Cherokee Indian Hospital said, "We don't just want you to build us a building; we want you to build us a beautiful building that the community absolutely loves, and that they claim as their own, and that helps promote greater engagement from them." The design team brought the local culture into the public spaces, especially the main concourse where a "River" runs throughout beneath the "trees" created by the structure.

Image source: http://www.hob.com/2010/01/cherokee-indian-hospital.html

Health Campus Without Walls

How will the design blur the boundary between the campus and its surroundings?

PROVIDE AMENITIES

When campuses use some of their land to provide amenities to the community, they pull residents onto the campus and bring life to the campus. Amenities are places which exist solely for the enjoyment of the users, to enrich the quality of their lives. They can include public art, theatres, parks and seating areas.

ExxonMobil School of Business

Sustainable Parking

Sustainable parking can be defined according to standard architect block: "A parking area that encourage the conservation of resources, incorporate stormwater management, promote energy efficiency, minimize waste, and improve outdoor environmental quality with respect to air, water, soil, planting and visual qualities."

Why?

For healthcare facilities, sustainable parking strategies can create a more positive experience for all building users. Additionally, instituting an integrated approach that avoids designing for a singular function can allow parking areas to become productive "landscapes" with ecological, social, cultural and economic benefits. Considering the essence of traditional parking structures, sustainable strategies may reduce future construction demands and building footprints if flexibly planned to incorporate. Integrating sustainable and therapeutic parking areas in提高着 the environmental quality, functionality and efficiency of a site, and improves the experience of patients, families and staff by creating a more calming atmosphere upon entry to the healthcare facility. Creating parking areas designed with natural features such as native plants and shade trees can decrease stress. As the temperature of artificial surfaces such as asphalt and concrete can be 60 to 80 degrees higher than vegetated surfaces, utilizing tree canopies to increase shade may increase the comfort level of users, decrease air temperatures, and counteract the "heat island" effect, improving air quality and reducing airborne pollutants. Additionally, low-impact parking lot design reduces stormwater runoff and pollutant loads.

Technical University of Denmark
Lyngby, Denmark

How to Implement

- Incorporate stormwater management systems by designing parking lots with vegetated swales, infiltration trenches, rain gardens and bio-retention areas.
- Plant tree canopies over ground lots to counteract the "heat island" effect.
- Design to "recycle rainwater runoff" for gray water usage.
- Utilize permeable paving materials to aid in stormwater management.
- Design **stack-under** parking areas to park underneath raised buildings, conserving land area.
- If structured parking is necessary, incorporate planters/bollards within the structure to be used as a natural rainwater filters before the water is absorbed into ground.
- Design for **multi-use** programs, such as play/exercise areas, cultural purposes and retail, including events such as farmer's markets, which can ultimately reduce land use.
- Divide lots into **smaller sections** to minimize the overall parking lot scale and decrease travel distances.
- Use **rooftop reflector fabric** over the top level of parking garages to reflect sunlight and reduce heat island effects.
- Use **internal light wells** to efficiently utilize daylight.

Strategies

Sustainable Surface Lot

Mixed-Use Parking Structure

Case Studies

Edwards Gardens Sustainable Lots

Toronto, Ontario, Canada
Schollen & Company

The design of the Edwards Gardens sustainable parking lot utilizes a system of permeable paving materials, bioswales with abundant native and adaptive tree/plantings, as well as integrated solar panels. The design for the sustainable parking lot incorporates measures that are aimed at **reducing infiltration of pollutants and reducing runoff rates**. Additionally, the parking lot integrates public art throughout to create a more active experience.
Image source: <http://www.schollen.com/case-studies/sustainable-parking-lot-at-edwards-gardens.html>

SAIT Parkade

Calgary, Alberta
Bing Thom Architects

Underneath a **green roof** soccer field is a three-story parking garage located on the Southern Alberta Institute of Technology campus. Designed by Bing Thom Architects, the garage minimizes parking usage by being **underground** and also utilizes a green roof to act as the **filtration** of rain water runoff. Through the use of a **certified mesh facade**, energy use from mechanical systems is reduced due to **passive ventilation** and sun shading.

INTEGRATED TRANSPORTATION NETWORK

How will the design influence user movement through the site?

Integrated Parking Options

Separated Parking Structure | LAPD Headquarters

Separated Parking | LAPD Headquarters

Parking Integrated Inside the Building | Mountain Dwellings Copenhagen

Ground Parking, Under Tree Canopy | Kresge Hall, Lexington, Kentucky

Walkability & Alternative Transportation

Walkability and alternative modes of transportation have a vital role in allowing comfortable access to all members of a community. Walkability of a site can be achieved by providing buffering from traffic, continuous sidewalks, identifiable and accessible crosswalks, rest areas, shelters, and visual interest.

Alternative transportation can be trip-related in various ways it can be communal and public (i.e. buses, subways and trains) or individual (i.e. bikes or cars). Communal transportation offers the possibility of interdependence, others' protection from the weather and makes travel for those unable to drive or walk for extended distances. One key drawback to communal transportation is its dependence on time schedules. On contrast, individual transportation by bike enables freedom from these schedules, and provides valuable exercise. Bike-sharing programs are a great opportunity for communities to encourage physical activity.

Walkability and alternative transportation not only help with sustainability by decreasing CO₂ emissions, but also have an impact on general public health and wellness by making people more active. Walking can be the gateway to protecting a healthy lifestyle for patients, visitors, and staff. Though it is important to provide enough efficient parking for patients and staff, alternative transportation and walkability can help reduce the need for parking spots. Walkability promotes healthy lifestyles and allows people to engage with nature and its therapeutic effects. Furthermore, easy access can help reduce stress and allow for a more pleasant visit.

Indianapolis Culture Trail
R.W. Armstrong & Rundell Ernstberger Assoc.

How to Implement

- **Bike racks and bike-sharing opportunities** for patients, staff, family members and the community
- Clear, safe, and accessible crosswalks and signage for pedestrians to be safe and have a clear walking path
- **Traffic calming solutions** for pedestrian safety
- **Sheltered bus and taxi pick-up/drop-off areas** for patients, family, and staff
- **Safe barriers** between pedestrians and vehicular traffic to ensure safety and avoidable incidence
- **Separation of traffic** of cars, buses, bicycles and pedestrians to ensure safety and a steady flow of traffic
- Provide **outdoor community space** such as gardens, outdoor eating spaces, and protected outdoor waiting areas to **engage people**

Strategies

Bike-Sharing Program

Case Studies

Castle Rock Adventist Hospital

Castle Rock, Co
Blue Navigators Marketing Group

The Castle Rock Adventist Hospital has a free **bike-share program** that allows the community to use 25 bikes made available on the hospital's campus. The bikes are located at four different locations in town, allowing people to輿de from one place to another while promoting health and wellness for the community.

<http://tinyurl.com/yd6vqjw> (Case study ID: 101)

Different Separation of Traffic

Oregon Health and Science University

Portland, OR
City of Portland

Portland has an award-winning public transportation system that has bus, train, and bike routes running by its hospitals. The public transportation routes run throughout the entire city to help ensure easy access for patients, visitors, and staff. At the bus stops there are sheltered areas protecting pedestrians from the elements while they wait.

<http://tinyurl.com/yd6vqjw> (Case study ID: 102)

Resources

Masselos, S., Loprinzi, V., Cachano, T., et al. (2006). A 1998 Survey Associated with Hospital Admissions from Home: Results of 174442 Patients in a National Sample of 167 Health Care Institutions in Argentina.

INTEGRATED TRANSPORTATION NETWORK

How will the design influence user movement through the site?

TRANSPORTATION NODES

Transport Nodes help simplify travel through the city and offer a multitude of solutions.

Most cities have several large stations that serve as major hubs for buses and trains, but simple bike parking or storage at a mass transit stop provides a convenience.

Parking accessible

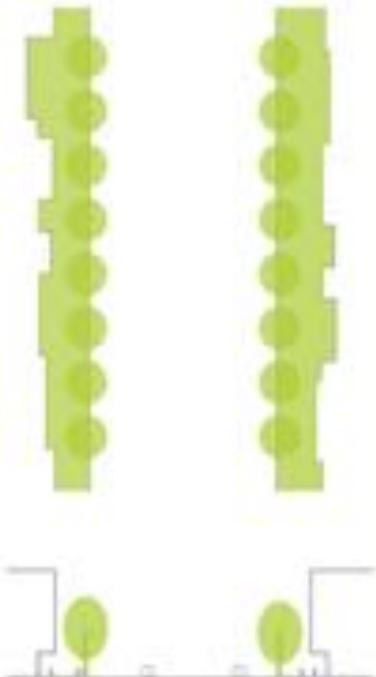

Calgary, Canada

Health Campus Without Walls

How will the design blur the boundary between the campus and its surroundings?

PEDESTRIAN FRIENDLY STREETS

Duke University, NC

NYU Langone Medical Hospital

Active Public Corridor

How will the design activate the public space?

Tempered green spaces

The green spaces with water features mitigate the environment temperature, filtering the air, and create pleasure environment for users. Also, the pleasure green spaces has the therapeutic impacts on patients in medical campus.

Computer Research Excellence and Technological Enterprise, Singapore

Easy Access and Legible Wayfinding

Easy access and legible wayfinding have as core elements the ability of an individual to...

- 1) know where he or she is,
- 2) know his or her destination,
- 3) know which route gets him or her to the destination,
- 4) know when he or she has reached the destination, and
- 5) know how to return.

From the moment someone arrives onto a hospital's property, the paths, visual cues, configuration of spaces, landmarks, and visual differences in symmetry of layout and signage work together to guide people and ease their movement throughout the healthcare facility.

Ensuring easy access and legible wayfinding into a healthcare facility is important for the seamless navigation of patients, visitors, visitors and staff on their respective journeys. At a time when people are often at their most vulnerable or are concerned for the health of a loved one, the ability to navigate a facility should seek no compromise. The decisions architects and designers make, from building entrance locations to finished interiors, influence the experience of navigating the space.

Additionally, elderly patients experience difficulty in wayfinding due to visual memory and visual impairment. Hospitals should seek to simplify wayfinding for all generations with consistent, familiar colors, frequent landmarks, and clear directional signage.

UCLA Outpatient Surgery and Oncology Center
Michael W. Fehlau Architects

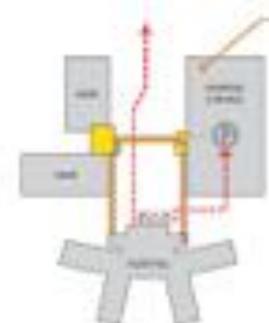

How to Implement

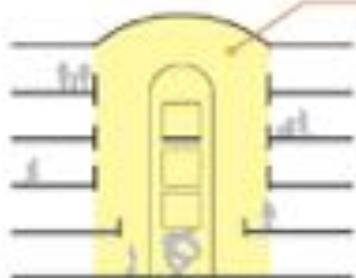

- Clear entry sequence for arrival, drop off, parking, and return to main entry
- Clear site lines from entrance to the street
- Views to the outside for campus orientation
- Simple organization along a central spine
- Inclusion of identifiable landmarks
- Reducing the complexity of routes in the facility
(i.e., multiple floors and moving between buildings)
- Reducing barriers from the general travel routes
- Consistent signage differentiating services

Strategies

Optimization of clear, definable circulation systems from all entries

Circulation within atriums and courtyards using key landmarks

Case Studies

Legacy Salmon Creek Hospital
Tumwater, Washington, USA
ZGF Architects

The design intent was to create clear, definable circulation systems to orient patients, staff and visitors beginning at the first entry to the site. The hospital, medical office buildings and parking structure are linked by an enclosed pedestrian bridge system. The entry lobbies for each component are expressed as glass volumes that provide welcoming and easily identifiable circulation paths.

<http://www.zgf.com/legacysalmoncreek> (accessed June 2007)

Orbis Medical Center
Sittard-Geleen, Netherlands
Holland Hospital Architects

Atriums act as a reference from multiple vantage points throughout the facility. Visitors are positively impacted with a clear visual understanding of their orientation to site wayfinding, provide a connection to nature and a sense of retreat inside the building. Placing sculptures, fountains, plants and monumental stairs in the atrium act as identifying landmarks to guide individuals and foster social connections.

<http://www.hha.nl/orbis/> (accessed June 2007)

Kraak, M., & Hillebrand, M. (2006). The use of design-based research to develop hospital design elements that contribute to employee ergonomics. *International Journal of Industrial Ergonomics*, 36(7), 447-458.

The Image of the City | The Image of the Hospital and Hospital Campus
Kevin Lynch

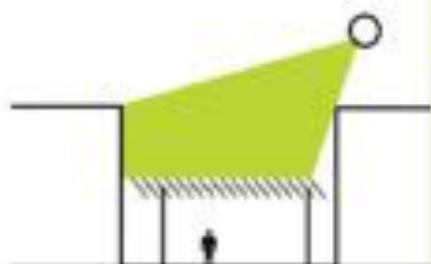

Active Public Corridor

How will the design activate the public space?

Shaded paths

Inviting walkways are created through the combination of proper pathways, materiality, width, shading, and lighting. These shaded paths create pleasurable environments for pedestrians to feel comfortable and safe as they journey to their destinations.

Campus for Research Excellence and Technological Enterprise, Singapore

Active Public Corridor

How will the design activate the public space?

Iconic landmark

Landmarks are the physical objects such as building, art monuments, and fountains which help people to navigate along the corridor to their destination. The significant physical characteristic of landmark is singularity, unique, and memorable in local context, making the landmark a key element in allowing a user to identify where they are.

UMDNJ Medical Center, Newark, New Jersey

Green Spaces, Roofs & Walls

Green spaces are defined as landscape that are partially or completely covered with vegetation such as trees, shrubs or water features. These pieces of land are set aside for aesthetic and functional purposes in the built environment. In healthcare, green spaces help enhance the beauty and quality of open areas on both the exterior and the interior of the facility and positively impact the building's culture. Green space includes parks and community gardens and can be used for recreational purposes. The word "green" has also become synonymous with the notion of sustainability in the building industry.

Green spaces engender connections to both nature and other living organisms. By immersing ourselves in natural surroundings, we stimulate the healing process.

Views to nature are therapeutic and foster a sense of place. Creating spaces that provide patients, staff and visitors relief from the daily stresses of their circumstances and work allows for greater resilience in the patient plane and work efficiency. The presence of serene views may also promote increased mobility and exercise.

Additionally, green spaces can reduce energy use and the carbon footprint of the building, which in turn, will reduce its lifecycle costs. The potential economic savings these spaces can provide are multi-faceted and include green spaces and environmental systems can also reduce heat island effects on roofs and assist with stormwater runoff and filtration.

Swiss Re Office Building
Hadi Tebrani

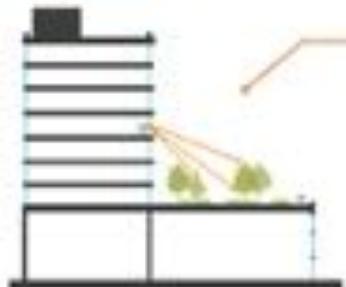

How to Implement

- Design internal courtyards to bring greenery into the public spaces and campus.
- Locate hospitals near existing parks and gardens and provide walkways to connect the facility to these areas.
- Provide attractive and vegetated public spaces on rooftops with seating that are accessible to patients, family and staff.
- Incorporate water features.
- Enhance the indoor walking experience by designing meandering pathways and green corridors that provide views to nature.
- Bring greenery into the main public spaces (e.g. lobbies and waiting areas) as well as into staff lounge/break rooms.
- Incorporate stormwater runoff management systems into green spaces.

Strategies

Green Roof Strategy

Case Studies

Palomar Medical Center

Jesuitka, CA
OD-Architects

Palomar Medical Center is a sustainable and high-performance healthcare facility that utilizes a green roof as one of their innovative design strategies. The technology extends to the landscape on the ground level as well as onto the roof. On the roof, accessibility is differentiated into distinct places, separated by level. Paved pathways also give users an opportunity to experience views from different vantage points and provide patients the positive distraction of green spaces outside their windows.

Image source:
<http://odarch.com/palomar-medical-center/>

Internal Courtyard

Bassel Rehab

Basel, Switzerland
Henning K. de Masi et al.

Bassel Rehab uses plazas, gardens and internal courtyards to attract and aid in the rehabilitation of patients. The internal courtyards are accessible garden spaces on the ground level and provide views from the circulation corridors above.

Image source:
<http://www.basel-rehab.ch/rehabilitation/therapies/physical-therapy/rehabilitative-plants.html>

Daylight & Connections to Nature

Daylight and connections to nature are two strategies aimed at improving patient and staff experience and outcomes. Daylighting is the practice of placing windows or other openings and reflective surfaces so that during the day, natural light provides effective internal lighting. This can maximize visual comfort and reduce energy usage. Connection to nature involves feeling the presence of the living world around us, which elevates the spirit. Connections may be visual (by looking or gazing through a window), or physical (by being able to walk through a garden).

Improved Experience

Patients' reported experience and perception of care, which are tied to funding, relate to the built environment. Various daylighting techniques can be used to create shadow or diffuse lighting depending on the intended experience.

Improved Health

Daylighting and access to nature can positively impact all building occupants, as they are connected to reduced hospital stays and improved mood. Daylight also regulates circadian rhythms (Björkstén, 2001). And finally, access to nature provides attention restoration (Kellert 2012), and reduces staff stress and fatigue.

Sustainability

Daylighting strategies can reduce artificial lighting needs. Green roofs on site can reduce heat island effects caused by impermeable surfaces, as well as filter and reduce runoff.

Perkins + Will

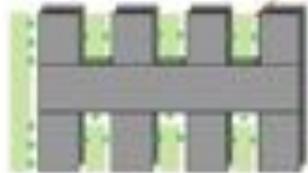

How to Implement

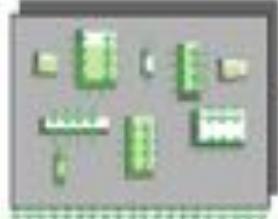

- Provide courtyard or accessible gardens, using articulated or perforated plans.
- Use floor-to-ceiling windows where possible, with dynamic shading systems for greater control of lighting.
- Interior rooms may still receive borrowed light from adjacent daylit spaces by using glass partitions.
- Exterior spaces can be programmed to encourage use.
- Provide skylights in patient rooms.
- Bring nature into the building by using plants, water features and natural materials such as wood and stones.

Strategies

Articulated Plan

Perforated Plan

Case Studies

Community Hospital of Brandenburg

Brandenburg, Germany
Heine, Winzer und Partner

Brandenburg uses the articulated plan to maximize the ratio of exterior walls to building area. Ribbons of windows along all of the facades allows for easy access to daylight and interaction with nature.

UZ Antwerpen-ZNA and UZA (Antwerp)

UZGCM, The Netherlands
De Jong Coevreker Algra

While the patient towers use an articulated form, the base of this project uses a central, daylit, multi-story atrium to bring borrowed light into various lower departments.

Basel Rehax

Basel, Switzerland
ZPP, Hennig & de Maeyer

Basel Rehax as a healing environment is characterized by its use of programmed courtyards in a perforated plan. Upon entering the facility there is an immediate view to one of the outdoor spaces. Another daylighting strategy used is skylighting, included in all patient rooms.

How do living natural elements lend urban functionality to architecture

POCKET PARK

A pocket park is defined by the large buildings and context surrounding it. It can be useful as an extension of the building's usage.

COURTYARDS

Daylight Intervention:

Daylight intervention in the courtyard can improve the quality of the interior lobby space, which attracts more people to stay in the courtyard and feel comfortable.

A photograph of a lush green park. In the foreground, there's dense green grass and some low-lying plants. On the left side, a large tree trunk is visible. In the middle ground, several people are sitting on a long, low metal bench. One person is sitting near the tree, another is further down the bench, and a third is near a black cylindrical trash can. In the background, there are more trees and a grassy hillside.

A place to relax for all
